Region 3

GENERAL DESCRIPTION

Region 3 encompasses 12 counties in northcentral and northeastern Wisconsin: Ashland, Florence, Forest, Iron, Langlade, Lincoln, Oneida, Price, Rusk, Sawyer, Taylor, and Vilas Counties. Glacial features include end, recessional and ground moraine, outwash and loess. Soils are a mix of sandy outwash, loams, silt and some clay.

Hydrological features are reflected in the wide variety of soils, topography and geology in the North Central and Northern Highland ecological landscape. Tamarack and black spruce forested wetlands exist on sandy outwash. Larger stands of black ash and northern white cedar forests occur as isolated forest wetlands on organic muck or mineral soils. The location of these forest types are determined by the flow of water over the landscape which are influenced by topography and soils. Acidic sites tend to be limited on groundwater and most rely on rainfall (peatlands). Other areas with slow moving groundwater have more nutrients leading to a dominance of cedar, ash and other species.

Region 3: Ashland, Florence, Forest, Iron, Langlade, Lincoln, Oneida, Price, Rusk, Sawyer, Taylor, and Vilas Counties

WETLAND FOREST HABITAT TYPES OF REGION 3

PmLLe

Primary Occurrence: Throughout Region 3

- *Picea-Larix/Ledum*
- Black Spruce-Tamarack/Labrador Tea

PmLNe

Primary Occurrence: Throughout Region 3

- *Picea-Larix/Nemopanthus*
- Black Spruce-Tamarack/Mountain Holly

AbThArAsp

Primary Occurrence: Forest & Langlade Counties

- *Abies-Thuja-Acer/Acer*
- Balsam Fir-Northern White Cedar-Red Maple/Mountain Maple

AbFnThOs

Primary Occurrence: Ashland, Iron & Price Counties

- *Abies-Fraxinus-Thuja/Osmunda*
- Balsam Fir-Black Ash-Northern White Cedar/Cinnamon Fern

AbFnThIx

Primary Occurrence: Langlade, Lincoln, Oneida & Vilas Counties

- *Abies-Fraxinus-Thuja/Ilex*
- Balsam Fir-Black Ash-Northern White Cedar/Winterberry

FnAbArOn

Primary Occurrence: Ashland, Iron & Price Counties

- *Fraxinus-Abies-Acer/Onoclea*
- Black Ash-Balsam Fir-Red Maple/Sensitive Fern

FnArl

Primary Occurrence: Ashland, Iron & Price Counties

- *Fraxinus-Acer/Impatiens*
- Black Ash-Red Maple/Spotted Touch-me-not

RELATIONSHIP OF HABITAT TYPES TO SOIL MOISTURE AND NUTRIENT REGIMES IN REGION 3

Region 3 Habitat Type Descriptions

PmLLe

Picea-Larix/Ledum

Picea mariana-Larix laricina/Ledum groenlandicum

Black Spruce-Tamarack/Labrador Tea

DISTRIBUTION

Throughout the region.

LANDFORM AND SOILS

Deep organic substrate – peat bog.

VEGETATION

Common Forest Cover Types: Stands are dominated entirely by black spruce and tamarack. Only paper birch and white pine occur as temporary associates. Advance reproduction consists almost entirely of black spruce and tamarack, but paper birch saplings are sometimes well represented. Other species that sometimes occur as saplings, but typically do not reach maturity, are red maple, balsam fir, yellow birch and eastern hemlock.

Shrub and Small Tree Layer: Tall shrubs are not well represented. The only conspicuous species with high coverage are Labrador Tea (*Ledum groenlandicum*), Mountain Holly (*Nemopanthus mucronata*) and Canada Blueberry (*Vaccinium myrtilloides*) and Low-sweet Blueberry (*Vaccinium angustifolium*). Several other woody species characteristic of this type are inconspicuous and best described with ground flora.

Ground Flora Characteristics: *Sphagnum* spp. is a dominant characteristic. Herb species are poorly represented. The following occur with low frequencies: Three-leaved Solomon's Seal (*Smilacina trifolia*), Yellow Beadlily (*Clintonia borealis*), Bunchberry (*Cornus canadensis*) and various species of Lady's Slippers (*Cypripedium* spp.). More frequent and often inconspicuous are species of the Heath family (*Ericaceae*), such as Leatherleaf (*Chamaedaphne calyculata*), Wintergreen (*Gaultheria procumbens*), Creeping Snowberry (*Gaultheria hispida*), Pale Laurel (*Kalmia polifolia*), Small Cranberry (*Vaccinium oxycoccus*), and Bog Rosemary (*Andromeda glaucophylla*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) PmLLe type is classified as “very poor” (see the **Management Implications** section).

REGION 3: PLANT SPECIES BY HABITAT TYPE (PmLLe)

PmLNe

Picea-Larix/Nemopanthus

Picea mariana-Larix laricina/Nemopanthus mucronata

Black Spruce-Tamarack/Mountain Holly

DISTRIBUTION

Throughout the region.

LANDFORM AND SOILS

Deep organic substrate – peat bog. Often in narrow zones adjacent to uplands, hydrologically nutrient enriched, therefore, less acidic than PmLLe type.

VEGETATION

Common Forest Cover Types: Most stands are dominated by black spruce and tamarack, but any of the following species can be common associates: balsam fir, northern white cedar, red maple, white spruce, paper birch and aspen. Advance reproduction typically is dominated by balsam fir and black spruce, but saplings of the following species are sometimes well represented: red maple, paper birch, tamarack and northern white cedar.

Shrub and Small Tree Layer: This layer may be sparse or moderately well developed. Best represented shrubs are Mountain Holly (*Nemopanthus mucronata*), Labrador Tea (*Ledum groenlandicum*), Canada Blueberry (*Vaccinium myrtilloides*), Low-sweet Blueberry (*Vaccinium angustifolium*) and speckled alder (*Alnus rugosa*). Some of the low shrubs (or “sub-shrubs”), mostly of the Heath family and characteristic of PmLLe habitat type, are occasionally present.

Ground Flora Characteristics: *Sphagnum* spp. is a dominant characteristic. Herb species are few and characteristic of wet-mesic uplands, e.g., Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Cinnamon Fern (*Osmunda cinnamomea*), and Yellow Beadlily (*Clintonia borealis*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) PmLNe type is classified as “poor” (see the **Management Implications** section).

AbThArAsp

Abies-Thuja-Acer/Acer • Abies balsamea-Thuja occidentalis-Acer rubrum/Acer spicatum
Balsam Fir-Northern White Cedar-Red Maple/Mountain Maple

DISTRIBUTION

Mostly Forest and Oneida Counties, and occasionally eastern Vilas and northern Langlade Counties. It also occurs east in Region 4.

LANDFORM AND SOILS

Landform is primarily pitted outwash or other ice contact deposits. Soils are sandy with the depth of organic horizon varying from less than six inches to more than two feet. Saturation depth, in years and seasons of sampling, was between two and three feet.

VEGETATION

Common Forest Cover Types: Most stands are dominated, singly or in combination, by balsam fir, northern white cedar and red maple. White spruce, paper birch, yellow birch and hemlock are occasional associates. Advance reproduction is typically dominated by balsam fir. Red maple, black spruce and black ash are sometimes present. Northern white cedar is conspicuously underrepresented in this layer, presumably largely due to deer browsing.

Shrub and Small Tree Layer: This layer may be sparse or moderately well developed. Best represented shrubs are Mountain Maple (*Acer spicatum*), speckled alder (*Alnus rugosa*), Beaked Hazel (*Corylus cornuta*), Fly Honeysuckles (*Lonicera* spp.), and Canada Blueberry (*Vaccinium myrtilloides*).

Ground Flora Characteristics: Herbaceous layer is moderately well developed and species rich. Species with the highest frequency of occurrence are Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Wild Sarsaparilla (*Aralia nudicaulis*), Dwarf Raspberry (*Rubus pubescens*), Cinnamon Fern (*Osmunda cinnamomea*), Yellow Beadlily (*Clintonia borealis*) and Oak Fern (*Dryopteris disjuncta*). *Sphagnum* spp. was present on 85 percent of study plots with average coverage of 40 percent.

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **AbThArAsp** type is classified as “poor to medium” (see the **Management Implications** section).

AbFnThOs

**Abies-Fraxinus-Thuja/Osmunda • Abies balsamea-Fraxinus nigra-Thuja occidentalis/Osmunda cinnamomea
Balsam Fir-Black Ash-Northern White Cedar/Cinnamon Fern**

DISTRIBUTION

Iron, Price and Taylor Counties and west.

LANDFORM AND SOILS

In this region the pattern of different types of glacial deposits is complex, often resulting in the occurrence of significantly different habitat types in very close proximity to each other. AbFnThOs habitat type occurs primarily where soils are of coarser textures. Surface organic layer is typically shallow, but on some plots it exceeded five feet. In the year of sampling, soil on most plots was saturated to the surface.

VEGETATION

Common Forest Cover Types: Most stands are dominated singly, or in combination, by northern white cedar, balsam fir, black ash and red maple. Advance reproduction is best represented by balsam fir, black ash and red maple. Northern white cedar is conspicuously underrepresented in this layer, presumably due largely to deer browsing.

Shrub and Small Tree Layer: This layer is not well developed. Best represented shrubs, but with relatively low coverage, are Mountain Holly (*Nemopanthus mucronata*), Mountain Maple (*Acer Spicatum*) and Beaked Hazel (*Corylus cornuta*). Less common species are Fly Honeysuckles (*Lonicera* spp.) and Red-osier Dogwood (*Cornus stolonifera*).

Ground Flora Characteristics: Herbaceous layer is not well developed. Species with highest frequency of occurrence are Starflower (*Trientalis borealis*), Bunchberry (*Cornus canadensis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Cinnamon Fern (*Osmunda cinnamomea*), Goldthread (*Coptis groenlandica*), Dwarf Raspberry (*Rubus pubescens*), Spotted Touch-me-not (*Impatiens capensis*), and Sensitive Fern (*Onoclea sensibilis*). *Sphagnum* spp. was present on 62 percent of study plots with average coverage of 11 percent.

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **AbFnThOs** type is classified as “poor to medium” (see the **Management Implications** section).

AbFnThlx

Abies-Fraxinus-Thuja/Ilex • Abies balsamea-Fraxinus nigra-Thuja occidentalis/Ilex verticillata
Balsam Fir-Black Ash-Northern White Cedar/Winterberry

DISTRIBUTION

Lincoln, Oneida and Vilas Counties and east.

LANDFORM AND SOILS

Substrate is either organic material, typically deeper than five feet, or very thin and underlain by mineral soil with sandy texture and saturated to near surface.

VEGETATION

Common Forest Cover Types: Most stands are dominated singly, or in combination, by balsam fir, northern white cedar, black ash and red maple. White spruce, yellow birch, white birch and hemlock are occasional associates. Advance reproduction is best represented by balsam fir and black ash. Northern white cedar is underrepresented in this layer, presumably due largely to deer browsing.

Shrub and Small Tree Layer: This layer is not well developed. Best represented shrubs are Beaked Hazel (*Corylus cornuta*), Currants/Gooseberries (*Ribes* spp.), Winterberry (*Ilex verticillata*), Juneberries (*Amelanchier* spp.), Mountain Maple (*Acer spicatum*), Fly Honeysuckles (*Lonicera* spp.) and Canada Blueberry (*Vaccinium myrtilloides*).

Winterberry (*Ilex verticillata*)

(Photo from Department of Natural Resources Archives)

Starflower (*Trientalis borealis*)

(Photo from Department of Natural Resources Archives)

Ground Flora Characteristics: Herbaceous layer is moderately well developed. Species with the highest frequency of occurrence are Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Wild Sarsaparilla (*Aralia nudicaulis*), Dwarf Raspberry (*Rubus pubescens*), Cinnamon Fern (*Osmunda cinnamomea*), and Oak Fern (*Dryopteris disjuncta*). *Sphagnum* spp. was present on 63 percent of study plots with average coverage of 15 percent.

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **AbFnThIx** type is classified as “poor to medium” (see the **Management Implications** section).

FnAbArOn

Fraxinus-Abies-Acer/Onoclea • *Fraxinus nigra-Abies balsamea-Acer rubrum/Onoclea sensibilis*
Black Ash-Balsam Fir-Red Maple/Sensitive Fern

DISTRIBUTION

Iron, Price and Taylor Counties and west.

LANDFORM AND SOILS

Landform is either ground moraines or outwash with parent materials of medium texture. A surface organic layer of one to three feet thick is underlain by mineral soil of sandy loam or loamy sand texture. In the year of sampling, the soil profile was saturated to near surface. About 25 percent of study plots had well decomposed organic layer to a depth greater than five feet.

VEGETATION

Common Forest Cover Types: Black ash typically dominates stands on this habitat type. Sporadic associates include balsam fir, paper birch, red maple and, infrequently, northern white cedar. Advance reproduction is best represented by black ash.

Shrub and Small Tree Layer: This layer is well developed. Most frequently present are speckled alder (*Alnus rugosa*), Currants/Gooseberries (*Ribes* spp.), Raspberries/Blackberries (*Rubus* spp.) and Mountain Maple (*Acer spicatum*). Less frequent are Red-osier Dogwood (*Cornus stolonifera*) and Mountain Holly (*Nemopanthus mucronata*).

Ground Flora Characteristics: Species with the highest constancies include Sensitive Fern (*Onoclea sensibilis*), Spotted Touch-me-not (*Impatiens capensis*), Bedstraws (*Galium* spp.), Spinulose Shield Fern (*Dryopteris spinulosa*), Dwarf Raspberry (*Rubus pubescens*), Marsh Marigold (*Caltha palustris*), and Horsetails (*Equisetum* spp.).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **FnAbArOn** type is classified as “poor to medium” (see the **Management Implications** section).

FnArl

Fraxinus-Acer/Impatiens

Fraxinus nigra-Acer rubrum/Impatiens capensis

Black Ash-Red Maple/Spotted Touch-me-not

DISTRIBUTION

Iron, Price and Taylor Counties and west.

LANDFORM AND SOILS

Regions dominated by ground moraines. The surface of the soil profile typically consists of a relatively shallow layer (one to two feet) of organic material in varying degrees of decomposition, from fibric to sapric. Mineral substrate near the surface is of medium to fine texture, e.g., loam, fine sand or silt loam, underlain by coarser-texture deposits. Saturated conditions were found at two to three feet. However, about 30 percent of plots had well decomposed organic material reaching depths greater than five feet.

VEGETATION

Common Forest Cover Types: Black ash is a predominant species in most stands. Common associates are red maple, paper birch and sometimes balsam fir. The same species are best represented in advance regeneration.

Shrub and Small Tree Layer: This layer is not well developed on this type. Most common are Currants/Gooseberries (*Ribes* spp.) and Raspberries/Blackberries (*Rubus* spp.). The following species occur with frequencies of less than 50 percent: Mountain Maple (*Acer spicatum*), Beaked Hazel (*Corylus cornuta*), Red-osier Dogwood (*Cornus stolonifera*) and speckled alder (*Alnus rugosa*).

Ground Flora Characteristics: Species with the highest constancies include Sensitive Fern (*Onoclea sensibilis*), Spotted Touch-me-not (*Impatiens capensis*), Bedstraws (*Galium* spp.), Spinulose Shield Fern (*Dryopteris spinulosa*), Dwarf Raspberry (*Rubus pubescens*), Marsh Marigold (*Caltha palustris*) and Horsetails (*Equisetum* spp.).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) FnArl type is classified as “medium” (see the **Management Implications** section). It is the richest type in Region 3.
