

(Photo from Kemp Natural Resources Station Archives)

Region 4

GENERAL DESCRIPTION

Region 4 encompasses Door, Marinette, Menominee, Oconto, and Shawano Counties. The entire region was glaciated during the Wisconsin glacial period. It is characterized by glacial and fluvioglacial landforms from lake plain, end moraine and outwash. Loams and silt loams are predominant soils and are developed over calcareous dolomite. Black spruce and tamarack forested wetlands exist on the sandy outwash in the northern portion of the region. Boreal conifer (white spruce and northern white cedar) and lowland black and green ash forested swamps exist on the lake plain influenced by Lake Michigan. Green ash is more predominant in the hardwood swamps of this region.

Region 4: Door, Marinette, Menominee, Oconto, and Shawano Counties

RELATIONSHIP OF HABITAT TYPES TO SOIL MOISTURE AND NUTRIENT REGIMES IN REGION 4

Region 4 Habitat Type Descriptions

PmLLe

Picea-Larix/Ledum

Picea mariana-Larix laricina/Ledum groenlandicum

Black Spruce-Tamarack/Labrador Tea

DISTRIBUTION

Throughout the region.

LANDFORM AND SOILS

Deep organic substrate – peat bog.

VEGETATION

Common Forest Cover Types: Stands are dominated entirely by black spruce and tamarack. Only paper birch and white pine occur as temporary associates. Advance reproduction consists almost entirely of black spruce and tamarack, although paper birch saplings are sometimes well represented. Other species that sometimes occur as saplings, but typically do not reach maturity, are red maple, balsam fir, yellow birch and eastern hemlock.

Shrub and Small Tree Layer: Tall shrubs are not well represented. The only conspicuous species with high coverage are Labrador Tea (*Ledum groenlandicum*), Mountain Holly (*Nemopanthus mucronata*) and Canada Blueberry (*Vaccinium myrtilloides*) and Low-sweet Blueberry (*Vaccinium angustifolium*). Several other woody species characteristic of this type are inconspicuous and best described with ground flora.

Mountain Holly (*Nemopanthus mucronata*)

(Photo from Department of Natural Resources Archives)

Pink Lady's Slipper (*Cypripedium acaule*)

(Photo from Department of Natural Resources Archives)

Ground Flora Characteristics: *Sphagnum* spp. is a dominant characteristic. Herb species are poorly represented. The following occur with low frequencies: Three-leaved Solomon's Seal (*Smilacina trifolia*), Yellow Beadlily (*Clintonia borealis*), Bunchberry (*Cornus canadensis*) and various species of Lady's Slippers (*Cypripedium* spp.). More frequent, although often inconspicuous, are several species of the Heath family (*Ericaceae*), such as Leatherleaf (*Chamaedaphne calyculata*), Wintergreen (*Gaultheria procumbens*), Creeping Snowberry (*Gaultheria hispida*), Pale Laurel (*Kalmia polifolia*), Small Cranberry (*Vaccinium oxycoccus*), and Bog Rosemary (*Andromeda glaucophylla*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **PmLLe** type is classified as “very poor” (see the **Management Implications** section).

PmLNe

Picea-Larix/Nemopanthus

Picea mariana-Larix laricina/Nemopanthus mucronata

Black Spruce-Tamarack/Mountain Holly

DISTRIBUTION

Throughout the region.

LANDFORM AND SOILS

Deep organic substrate – peat bog. Often in narrow zones adjacent to uplands, hydrologically nutrient enriched, therefore, less acid than PmLLe type.

VEGETATION

Common Forest Cover Types: Most stands are dominated by black spruce and tamarack, but any of the following species can be common associates: balsam fir, northern white cedar, red maple, white spruce, paper birch and aspen. Advance reproduction is typically dominated by balsam fir and black spruce, but saplings of the following species are sometimes well represented: red maple, paper birch, tamarack and northern white cedar.

Shrub and Small Tree Layer: This layer may be sparse or moderately well developed. Best represented shrubs are Mountain Holly (*Nemopanthus mucronata*), Labrador Tea (*Ledum groenlandicum*), Canada Blueberry (*Vaccinium myrtilloides*), Low-sweet Blueberry (*Vaccinium angustifolium*) and speckled alder (*Alnus rugosa*). Some low shrubs (or “sub-shrubs”), mostly of the Heath family and characteristic of PmLLe habitat type, are occasionally present.

Ground Flora Characteristics: *Sphagnum* spp. is a dominant characteristic. Herb species are few and characteristic of wet-mesic uplands, e.g., Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Cinnamon Fern (*Osmunda cinnamomea*), and Yellow Beadlily (*Clintonia borealis*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) PmLNe is classified as “poor” (see the **Management Implications** section).

ThAbFnC

Thuja-Abies-Fraxinus/Coptis • *Thuja occidentalis-*

Abies balsamea-Fraxinus nigra/Coptis groenlandica

Northern White Cedar-Balsam Fir-Black Ash/Goldthread

DISTRIBUTION

Throughout northwestern parts of Marinette and Oconto Counties, areas characterized by pitted outwash.

LANDFORM AND SOILS

Pitted outwash and other ice-contact glacial deposits (see page 8-2, "Glacial Deposits" map). Soil profile is most often characterized by one to two feet of well decomposed organic matter, underlain by sandy mineral material. Early summer saturation depth was within two feet. In some instances, the organic layer exceeds five feet.

VEGETATION

Common Forest Cover Types: Most stands are dominated, singly or in combination, by northern white cedar, balsam fir, black ash, paper birch and red maple. Black spruce, yellow birch and eastern hemlock are occasional associates. Advance reproduction is typically dominated by northern white cedar, balsam fir and black ash. Red maple and yellow birch reproduction is sometimes present.

Shrub and Small Tree Layer: This layer is often sparse. Most often present species are Winterberry (*Ilex verticillata*), Juneberries (*Amelanchier* spp.), Mountain Maple (*Acer spicatum*), Beaked Hazel (*Corylus cornuta*) and Canada Blueberry (*Vaccinium myrtilloides*).

Ground Flora Characteristics: Herbaceous layer is well developed and species rich. Species with the highest frequency of occurrence are Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Wild Sarsaparilla (*Aralia nudicaulis*), Dwarf Raspberry (*Rubus pubescens*), Cinnamon Fern (*Osmunda cinnamomea*), Yellow Beadlily (*Clintonia borealis*) and Oak Fern (*Dryopteris disjuncta*). *Sphagnum* spp. was present on 86 percent of study plots with average coverage of 24 percent.

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **ThAbFnC** type is classified as "poor to medium" (see the **Management Implications** section).

AbThArAsp

Abies-Thuja-Acer/Acer • *Abies balsamea-Thuja occidentalis-Acer rubrum/Acer spicatum*

Balsam Fir-Northern White Cedar-Red Maple/Mountain Maple

DISTRIBUTION

Mostly Forest and Oneida Counties and occasionally eastern Vilas and northern Langlade Counties. It also occurs in adjacent Region 4.

LANDFORM AND SOILS

Landform is primarily pitted outwash or other ice contact deposits. Soils are sandy with a depth of organic horizon varying from less than six inches to more than two feet. Saturation depth, in years and seasons of sampling, was between two and three feet.

VEGETATION:

Common Forest Cover Types: Most stands are dominated singly, or in combination, by balsam fir, northern white cedar and red maple. White spruce, paper birch, yellow birch and eastern hemlock are occasional associates. Advance reproduction is typically dominated by balsam fir. Red maple, black spruce and/or black ash are sometimes present. Northern white cedar is conspicuously underrepresented in this layer, presumably due to deer browsing.

Shrub and Small Tree Layer: This layer may be sparse or moderately well developed. Best represented shrubs are Mountain Maple (*Acer spicatum*), speckled alder (*Alnus rugosa*), Beaked Hazel (*Corylus cornuta*), Fly Honeysuckles (*Lonicera* spp.), and Canada Blueberry (*Vaccinium myrtilloides*).

Mountain Maple (*Acer spicatum*)

(Photo from Department of Natural Resources Archives)

(Photo from Department of Natural Resources Archives)

Ground Flora Characteristics: Herbaceous layer is moderately well developed and species rich. Species with the highest frequency of occurrence are Bunchberry (*Cornus canadensis*), Starflower (*Trientalis borealis*), Spinulose Shield Fern (*Dryopteris spinulosa*), Wild Lily-of-the-valley (*Maianthemum canadense*), Goldthread (*Coptis groenlandica*), Wild Sarsaparilla (*Aralia nudicaulis*), Dwarf Raspberry (*Rubus pubescens*), Cinnamon Fern (*Osmunda cinnamomea*), Yellow Beadlily (*Clintonia borealis*), and Oak Fern (*Dryopteris disjuncta*). *Sphagnum* spp. was present on 85 percent of study plots with average coverage of 40 percent.

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) **AbThArAsp** type is classified as “poor to medium” (see the **Management Implications** section).

FnThAbAt

Fraxinus-Thuja-Abies/Athyrium

Fraxinus nigra-Thuja occidentalis/Athyrium filix-femina

Black Ash-Northern White Cedar-Balsam Fir/Lady Fern

DISTRIBUTION

Mostly in parts of central Marinette and Oconto Counties characterized by ground moraine landforms.

LANDFORM AND SOILS

Landform typically is ground moraine. Soil profile consists of a surface layer of well decomposed black muck underlain by mineral soil of relatively fine texture. If sub-soil is sandy, it typically contains a clay or silty component. The saturated zone is typically within three feet of the surface. On some plots, depth of a well decomposed organic layer exceeded four feet.

VEGETATION

Common Forest Cover Types: Black ash and northern white cedar are the predominant species in most stands. Common associates are red maple and balsam fir. Yellow birch and paper birch are sometimes present. The same species are best represented in advance regeneration.

Shrub and Small Tree Layer: This layer is mostly lacking. No shrub species exceeded 40 percent constancy and, when present, the coverage was negligible. Observed species included Currants/Gooseberries (*Ribes* spp.), Raspberries/Blackberries (*Rubus* spp.), Mountain Maple (*Acer spicatum*), Beaked Hazel (*Corylus cornuta*), Red-osier Dogwood (*Cornus stolonifera*), and speckled alder (*Alnus rugosa*).

Ground Flora Characteristics: This layer is well developed and species rich. Highest coverage is represented by grasses and sedges. Species with highest constancies include Lady Fern (*Athyrium filix-femina*), Jack-in-the-pulpit (*Arisaema triphyllum*), Virginia Creeper (*Parthenocissus* spp.), Spinulose Shield Fern (*Dryopteris spinulosa*), Dwarf Raspberry (*Rubus pubescens*), Wild Sarsaparilla (*Aralia nudicaulis*), and Sensitive Fern (*Onoclea sensibilis*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) FnThAbAt type is classified as “medium” (see the **Management Implications** section).

REGION 4: PLANT SPECIES BY HABITAT TYPE (FnThAbAt)

FnUB

Fraxinus-Ulmus/Boehmeria

Fraxinus nigra-Ulmus spp./Boehmeria cylindrica

Black Ash-Elms/False Nettle

DISTRIBUTION

Best represented in eastern parts of Marinette and Oconto Counties.

LANDFORM AND SOILS

Primarily on glacio-lacustrine deposits associated with the Green Bay lobe (see page 8-2, “Glacial Deposits” map). Most often mineral soil of varying texture, but typically containing a significant proportion of clay and silt in the upper portion of the profile, and coarser materials below. Saturation zone typically within three feet of the surface. Substrate on about 30 percent of study plots consisted entirely of well decomposed organic matter (black muck) to a depth greater than five feet.

VEGETATION

Common Forest Cover Types: Black or green ash is a predominant species in most stands. Common associates are (formerly) red elm and silver maple. Conifers almost entirely lacking. The same species, except for elm, are best represented in advance regeneration.

Shrub and Small Tree Layer: This layer is not well developed. Only Currants/Gooseberries (*Ribes* spp.) occurs with high constancy (91 percent). The following species occur with frequencies less than 50 percent: Chokecherry (*Prunus virginiana*), Common Elderberry (*Sambucus canadensis*), Winterberry (*Ilex verticillata*), and Glossy Buckthorn (*Rhamnus frangula*).

Ground Flora Characteristics: The herb layer is well developed and species rich. Grasses and sedges represent the highest coverage, but the following herbs are well represented: Virginia Creeper (*Parthenocissus* spp.), Dwarf Raspberry (*Rubus pubescens*), Bugleweed (*Lycopus uniflorus*), False Nettle (*Boehmeria cylindrica*), Spotted Touch-me-not (*Impatiens capensis*), and Sensitive Fern (*Onoclea sensibilis*).

Disturbance and Succession: See the Introduction.

Management Implications: On the relative scale of wetland habitat type productivity (very poor, poor, poor to medium, medium, medium to rich) FnUB type is classified as “medium to rich” (see the **Management Implications** section). It is the richest type in Region 4.
